

Paravision Search Lite

Lightweight, fully-integrated face recognition engine

Paravision Search Lite is a fully-integrated, Docker-based face recognition engine, capable of processing video or still imagery from a single computer or cloud instance, enabling simple integration and use of Paravision face recognition.

Search Lite combines Paravision's NIST FRVT-leading face recognition technology, IP video processing from the Paravision Streaming Container, and high-speed matching technology from Paravision Search into a unified Docker container and API, delivering high performance, high accuracy face recognition in an easy-to-deploy package.

Paravision Search Lite is designed for applications where Paravision's standard Docker products may not be an optimal fit, including:

- Rapid technology assessment or proof-of-concept development where simplicity is key, scalability is not required, and flexibility for video or image inputs is useful.
- Single-computer deployments, as may be needed in Edge server applications or mobile workstation applications.
- Simple integration with Video Management Systems (VMS) where a unified face recognition API pipeline is preferred to integration of multiple modular Docker containers.

Key Features

- Single server compute footprint for small and medium-sized use cases.
- 1-second response time for a gallery of 1 million records.
- Integration capabilities with video management systems for real-time alerts.
- Combines functionality from Paravision's Streaming and Processor Dockers with basic search capabilities into a single container.

Supported Cloud Platforms and Computing Environments

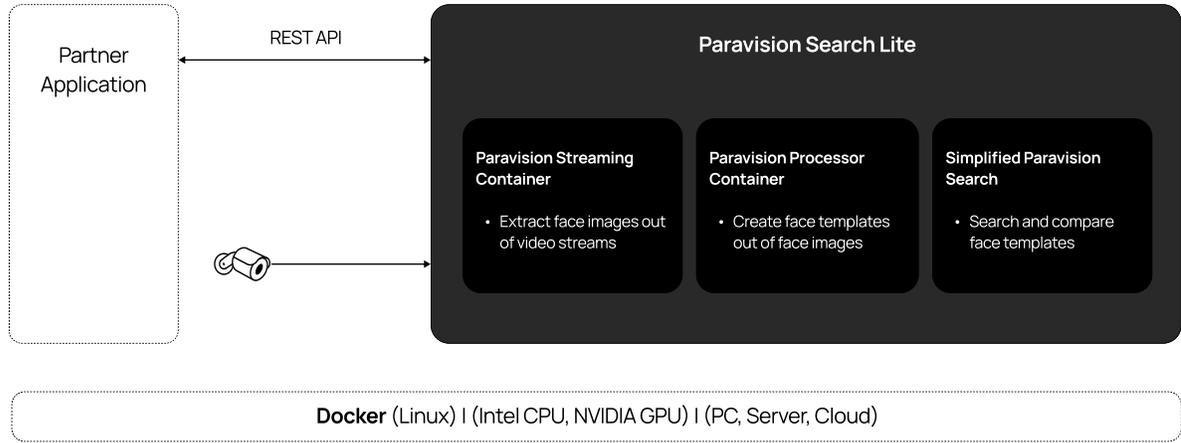

Search Lite can be deployed using the following platforms and environments:

On-Premises / Private Cloud	Google Cloud Platform	Amazon Web Services	Microsoft Azure
			

Technical Specifications

Deployment method	Docker container, supporting on-premises or cloud-based (including GCP, AWS, Azure)
Supported operating system	Linux Windows
Supported template generation platform	Intel CPU (OpenVINO) NVIDIA GPU (TensorRT)
Client interface	REST API

System Architecture
